

Super Speed Trader Settings & Rules

- We enter trades Mondays – Fridays at 10:30 AM ET
- All trades are based on Hourly Time Frames
- We use a 14 Bar setting for ADX, DMI+, and DMI-
- Bullish Signal – We look for a reversal on the DMI lines (DMI+ crossing above DMI-) and the ADX trending higher for two consecutive bars

- Bearish Signal – We look for a reversal on the DMI lines (DMI- crossing above DMI+) and the ADX trending higher for two consecutive bars
- After a trade is entered, we use an ADX turn (Current bar's ADX closes lower than the prior bar's ADX) to close an open position
- If an open position is up greater than +100% we will monitor the trade for a breakeven stop
- If the position is not closed after 5 trading sessions, the position will be closed for a time stop
- We select the options of the next-week expiration, and we choose the option priced most closely to the daily 20 Period Average True Range x 0.5
